

Preserving the Continental Laurissilva Relict

Rhododendron (Rhododendron ponticum subsp. baeticum)

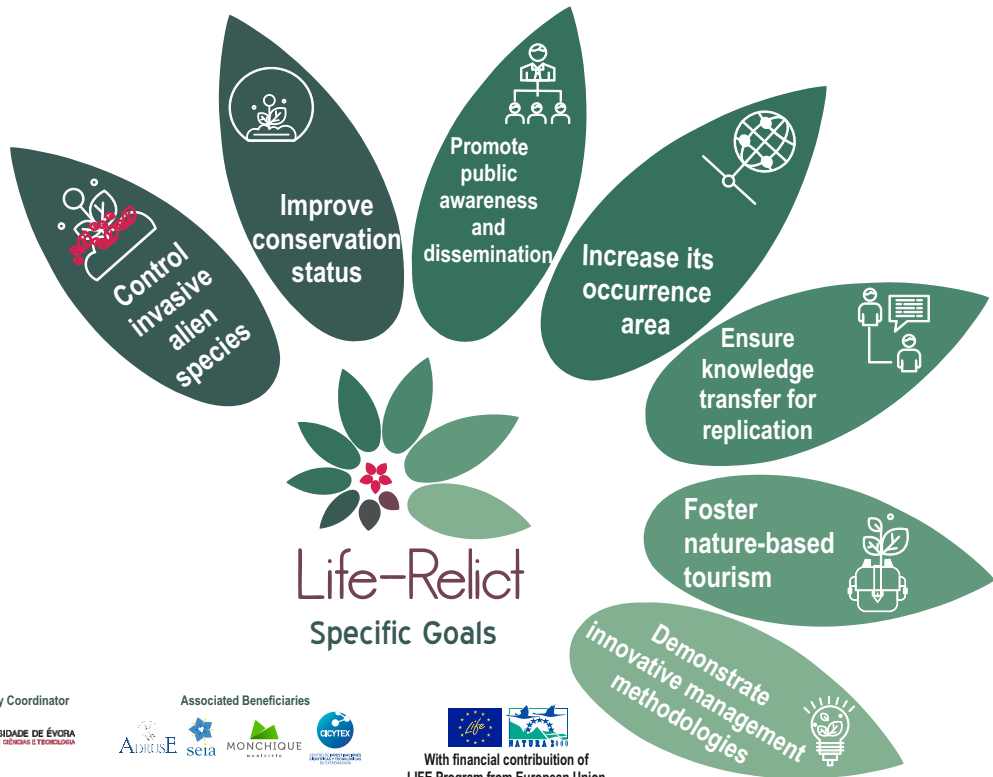

Life-Relict project aims to conserve a rare habitat dominated by *Rhododendron*. It's a testimony plant from Laurissilva forest that occupied the Iberian Peninsula in past geological times, when the dominant climate was subtropical (hotter and humid than the present). Today, *Rhododendron* is rare and threatened which remains only in small refuges such as Monchique.

Come visit and help preserving this heritage!
